

View

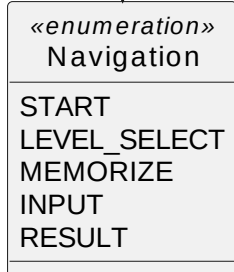

Acts as the View layer.
Sets up the application UI and renders different Composable screens based on the ViewModel's state.

Controller

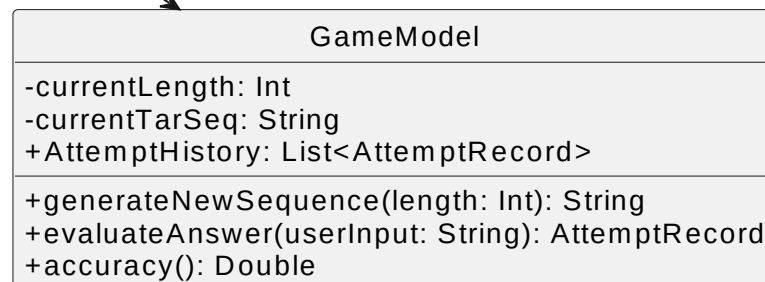

Acts as the Controller.
Manages UI state, handles user events, and bridges communication between the View and Model.

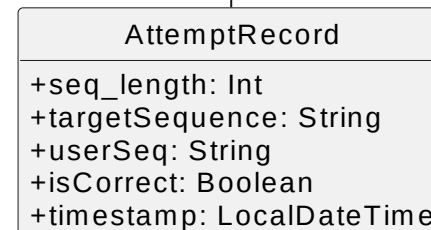

Defines the possible UI screen states for routing.

Model

Core business logic engine.
Generates game sequences, evaluates user guesses, and tracks the history of attempts.

Data class holding the details and result of a single game attempt.
